After Class 10:

Activity 1 - Hi-Fi prototype progress:
Github repo: https://github.com/Conor-McCoy/CS3041Project/tree/AfterClass10Proto
Progress:
- Changed color palette
- Added pages for connecting to job board & adding application details
- Made update feedback button clear the text in the box above
- Implement changes from lo-fi after class 9 (file information, ability to remove, upload button so they can confirm its correct file before uploaded)

To-do:
- Remove the section at the bottom with checkboxes & text box and make it another clickable button like connect to job board & add application details.
- Make the sidebar able to handle multiple of these pages, when all 3 (job board, customize feedback, application details) on screen, height should be the same as the main section.
- Reorganize layout for desktop website?

Activity 2 - Operationalized Measurements w.r.t. UX Laws:
- Postel's law:
  - Allow users to enter application details as a copy/paste without limiting them (as seen in the 3rd screenshot above).

- Instead of entering a link to the application, allows for scenarios where the website is protected against viewing without an account (what the program could see), as well as when the application details appear in a pop-up window without changing the link.
  - Will reduce amount of scenarios that result in error

Activity 3 - One unit of iteration:
- Changed color palette
- Added linkedin and indeed styling to buttons
- Rounded some buttons to give softer feel to website
